L08 Announcement

1. HW5 is released!
2. **Problem-Solving method for probability problems**: Ask yourself what event must happen on the first trial:
   a. If there's a clear answer (e.g. "not a six") whose probability you know, you can most likely use the multiplication rule.
   b. If there's no clear answer (e.g. "could be K or Q, but then the next one would have to be Q or K . . . "), list all the distinct ways your event could occur and add up their chances.
   c. If the list above is long and complicated, look at the complement. If the complement is simpler (e.g. the complement of "at least one" is "none"), you can find its chance and subtract that from 1.
3. For help with course content please use **TA office hours**.
4. For issues with grades, please reach out to your TA first.
